### Kent Steel Ltd.

5441 52 Avenue SE , Calgary, AB T2C 4S5

is certified to CSA Standard W47.1

"Certification of Companies for Fusion Welding of Steel"

in DIVISION 2

for the period March 10, 2012 to April 9, 2013

**Company Code: KENTS1** 

Scope: Structural steel fabricator - fabrication of structural steel, miscellaneous steel and steel plate works for the oil and gas and petro-chemical industries. Also fabrication of structural steel, miscellaneous steel and steel plate works for buildings.

#### A SCOPE

This Welding Procedure Specification covers welding and related operations in accordance with CSA Standard W59-03 and has been prepared to meet the requirements of Clause 10 of CSA Standard W47.1-03.

#### B WELDING PROCEDURE

The welding shall be done manually using the shielded metal are welding process (SMAW). The joints shall be made by single or multiple pass welding from one or both sides as indicated on the Welding Procedure Data Sheet referring to this Specification.

#### C BASE METAL

The base metal shall conform to Steel Groups 1, 2 & 3 of CSA Standard W59 – Table 11.1 and Table 12.1 with the exception of the atmospheric corrosion resistant steels. A copy of Tables 11.1 and 12.1 appears in the Appendix. If atmospheric corrosion resistant steels are to be used, they shall be shown on a separate data sheet.

#### D BASE METAL THICKNESS

Base metal from 3mm (1/8") to unlimited thickness may be welded under this Specification. In cases where base metals less than 3mm (1/8") thick are welded refer to Clause 1.5 of CSA Standard W59.

#### E PREPARATION OF BASE MATERIAL

Surfaces and edges to be welded shall be smooth, uniform and free from fins, cracks and other defects that would adversely affect the quality or strength of the weld. Surfaces to be welded shall also be free, within 50mm (2") of any weld locations, from loose or thick scale (except for tightly adhering small islands of scale), slag, loose rust, paint, grease, moisture and other foreign material that will prevent welding to acceptance criteria of this standard.

Occasional notches, not more than 5mm (3/16") deep, on otherwise satisfactory surfaces shall be removed by machining or grinding. Occasional notches exceeding 5mm (3/16") and less than 10mm (3/8") deep, in oxygen cut edges of plate up to 100mm (4") thick not to be welded, may, with the Contractor's Engineer's approval, be repaired by welding. For material 100mm (4") thick or over the depth of the notch shall not exceed 15mm (9/16"). Such weld repairs shall be made by suitably preparing the defective area, welding with low-hydrogen electrodes to an approved procedure, and grinding the completed weld smooth and flush with the adjacent surface to produce a workmanlike finish.

Planar edge discontinuities of plates are to be inspected in accordance with Clause 5.3.5 of CSA Standard W59.

Re-entrant corners, except for the corners of weld access cope holes adjacent to a flange shall be filleted to a radius of not less than 12mm (1/2").

The transition from the curved to the straight surface shall be smooth and without offsets.

Preparation of surfaces or edges of the parts to be joined by welding shall be prepared by machining, shearing, grinding, chipping, air carbon arc or oxygen gouging. Back gouging of welds or the removal of defective work or material shall be done by grinding, chipping, air carbon arc or oxygen gouging. Oxygen gouging shall not be used on quenched or tempered steels. Oxygen cutting shall preferably be done by machine oxygen cutting. Oxygen cut cdges shall be smooth, regular, and free of slag.

#### F FILLER METAL

The filler metal shall be certified by the Canadian Welding Bureau to the requirements of CSA W48-01 Filler Metals and Allied Materials for Metal Arc Welding.

#### G POSITION

The welding shall preferably be done in the flat position. The horizontal, vertical, or overhead positions may be used provided approved welding procedure data sheets referring to those positions and this procedure specification are followed. Unless otherwise called for on a specific data sheet, vertical welds shall be made with the progression of each pass in an

upward direction. If welds are to be made in a vertical-down sequence, the procedure shall be qualified by welder qualification in accordance with Clauses 9.9.3 of CSA Standard W47.1.

#### H PREHEAT AND INTERPASS TEMPERATURES

The minimum preheat and interpass temperature shall be in accordance with Table 5.3 of CSA Standard W59 (as shown in the Appendix). The preheat and interpass temperatures must be sufficient to prevent cracking. Experience has shown that the minimum levels specified in Table 5.3 are adequate to prevent cracking in most cases. However, higher preheats may be required in situations involving higher restraint, higher hydrogen, certain combinations of steel thickness, lower welding heat input, or steel composition at the top end of the steel specification. Some alternate recognized methods or guidelines for determining preheat are given in Appendix P of CSA Standard W59.

### I ELECTRICAL CHARACTERISTICS

The welding current shall be AC or DC RP. The welding equipment shall have drooping voltage characteristics. The following tables show recommended amperage and voltage ranges of commonly used electrodes.

#### Electrode Classification E4918-1

| Diameter |        | Amperage  | Voltage |  |  |
|----------|--------|-----------|---------|--|--|
| mm       | inches | Range     | Range   |  |  |
| 2.5      | 3/32   | 90 - 120  | 20 - 23 |  |  |
| 3.2      | 1/8    | 120 - 150 | 21 - 24 |  |  |
| 4.0      | 5/32   | 150 - 210 | 21 - 24 |  |  |
| 5.0      | 3/16   | 200 - 275 | 22 - 25 |  |  |
| 6.0      | 1/4    | 275 - 360 | 22 - 27 |  |  |

#### Electrode Classification E4928

| Diameter |        | Amperage Range    | Voltage |  |
|----------|--------|-------------------|---------|--|
| mm       | inches | Flat & Horizontal | Range   |  |
| 3.2      | 1/8    | 130 - 170         | 22 - 26 |  |
| 4.0      | 5/32   | 180 - 240         | 22 - 26 |  |
| 5.0      | 3/16   | 230 - 300         | 23 - 27 |  |

### Electrode Classification E4924

| Diameter |        | Amperage Range    | Voltage        |
|----------|--------|-------------------|----------------|
| mm       | inches | Flat & Horizontal | Range          |
| 3.2      | 1/8    | 125 - 165         | <b>28 32</b> ° |
| 4.0      | 5/32   | 175 - 235         | 32 - 35        |
| 5.0      | 3/16   | 240 - 350         | 32 - 35        |

### Electrode Classification E4310

| Diameter |        | Amperage . | Voltage |
|----------|--------|------------|---------|
| mm       | inches | Range      | Range   |
| 3.2      | 1/8    | 90 – 140   | 24 - 26 |
| 4.0      | 5/32   | 120 - 175  | 24 - 28 |
| 5.0      | 3/16   | 140 - 225  | 24 - 28 |

The maximum tolerances on the amperage listed on the procedure data sheets referring to this Specification shall be  $\pm 10\%$ .

### J WELDING TECHINQUE

The maximum thickness of layers shall be:

6mm (1/4") - for root passes of groove welds with the minimum size being such to prevent cracking.

5mm (3/16") - for subsequent layers of welds made in any position.

The maximum electrode size shall be:

4mm (5/32") - all passes in vertical fillet and groove welds.

5mm (3/16") - all passes in overhead fillet and groove welds.

- all passes in horizontal groove welds.

- root passes in grooves with backing where the root opening is less than 6mm (1/4") in the flat position.

- root passes in grooves without backing in the flat position.

6mm (1/4") - all passed for horizontal fillet welds.

- root passes for fillets in the flat position.

- root passes in grooves with backing where the root opening is greater than 6mm (1/4") in the flat position

8mm (5/16") - all passes subsequent to root passes for fillet and groove welds made in the flat position.

The maximum one pass fillet weld size shall be:

10mm (3/8") - in the flat position.

8mm (5/16") - in the horizontal or overhead position.

13mm (1/2) - in the vertical position.

The maximum width of one pass layers shall be such that weaving of the electrode is limited to 2 ½ times the electrode diameter.

The stringer bead technique should be used maintaining a short arc. Each pass should fuse properly into any backing plate, preceding pass, or adjacent plate metal. No unfilled or unfused pockets should be left between weld beads.

#### K WELDING CONDITIONS

No welding shall be done when temperatures of the base metal is lower than -18°C (0°F) except with the express consent of the Engineer. At temperatures below 0°C (32°F), the surfaces of all areas within 80mm (3") of the joint where a weld is to be deposited shall be heated to a temperature at least warm to the hand before welding is commenced – approximately 10°C (50°F).

The operator and the work shall be adequately protected against the direct effect of wind, snow, and rain.

#### L WELD PROFILES

The desirable, acceptable, and unacceptable fillet weld profiles are shown in Figure 5.4 in the Appendix.

The acceptable and unacceptable groove weld profiles are shown in Figure 5.4 in the Appendix.

#### M TREATMENT OF UNDERSIDE OF WELDING GROOVE

Prior to depositing weld metal on the underside of a welding groove, the root shall be back gouged to produce a groove contour substantially conforming to the prequalified single U-Joint and its depth shall be adequate to ensure complete penetration into the previously deposited weld metal.

#### N WELD METAL CLEANING

Slag shall be removed from all finished welds and before welding over previously deposited welds.

#### O TACK WELDS

Tack welds that are incorporated into the final weld shall be subject to the same quality requirements as the final welds and be made with electrodes meeting the requirements of the final welds and shall be cleaned thoroughly.

Tack welds not incorporated into the final weld shall be removed – except that they need not be removed for statically loaded structures unless required by the Engineer.

Tack welds located in the path of fillet welds 10mm (3/8") or smaller in size or in the roots of joints requiring specific root penetration shall be sufficiently small that they do not produce objectionable changes in the appearance of the weld surface or result in a decrease in penetration, otherwise they shall be removed or reduced in size by any suitable means prior to welding.

#### P ARC STRIKES

Are strikes outside of the area of permanent welds should be avoided on any material. When they occur in dynamically loaded structures, the surface of the arc strike should be lightly ground and checked for soundness using the magnetic particle inspection method.

#### Q ASSEMBLY PRACTICES

The parts to be joined by fillet welds shall be brought into as close a contact as practicable. The separation between parts shall normally not exceed 5mm·(3/16") except in cases involving shapes and plates 75mm (3") thick or greater when, after straightening and in assembly, the gap cannot be closed sufficiently to meet this tolerance. In such cases, a maximum gap of 8mm (5/16") is acceptable, provided that the sealing weld or suitable backing material\* is used to prevent melt-through.

If the separation is 2mm (1/16") or greater, the leg of the fillet weld shall be increased by the amount of the separation.

The separation between faying surfaces of lap joints and of butt joints landing on a backing shall not exceed 2mm (1/16"). Where irregularities in rolled shapes or plates after straightening do not permit contact within the above limits, the procedure necessary to bring the material within these limits shall be subject to the approval of the Engineer.

The parts, bearing joints excepted, to be joined by partial joint penetration having groove welds parallel to the length of the member shall be brought into as close contact as practicable. The gap between parts shall not exceed 5mm (3/16") except in cases involving rolled shapes and plates 75mm (3") or greater in thickness when, after straightening and in assembly, the gap cannot be closed sufficiently to meet this tolerance. In such cases, a maximum gap of 8mm (5/16") is acceptable provided a sealing weld or suitable backing material\* is used to prevent melt-through and the final weld meets the requirements for throat size. Tolerances for bearing joints shall be in accordance with the applicable contract specification.

The use of fillers is prohibited except as specified on the drawings or as specially approved by the Engineer and made in accordance with Clause 4.6 of CSA Standard W59.

<sup>\*</sup> Backing to prevent burn-through may be of flux, glass tape, iron powder or similar material or it may be provided by means of root passes deposited by a low-hydrogen electrodes or electrodes of other arc welding processes that are specified to an appropriate diffusible hydrogen designator.

Abutting parts to be joined by groove welds shall be carefully aligned. However, an offset not exceeding 10% of the thickness of the thinner part joined but in no case more than 3mm (1/8") shall be permitted as a departure from the theoretical alignment. In correcting misalignment in such cases, the parts shall not be drawn into a slope greater than 1 in 25. Measurement of the offset shall be based on centerline of parts unless otherwise shown on the drawing.

Backing for groove welds shall be continuous for the full length of the joint. Where backing is composed of individual lengths of bars, they shall be carefully aligned and welded into one continuous member.

Members to be welded shall be brought into correct alignment and held safely in position until welding has be completed. Suitable allowances shall be made for warpage and shrinkage.

#### R ALLOWABLE WORKMANSHIP TOLERANCES

With the exclusion of electroslag and electrogas welding and, with the exception of Clause 5.4.5.2 of CSA Standard W59 for root openings in excess of those permitted in the table below, dimensions of the cross-section of groove welded joints that vary from those shown on the detail drawings by more than the following workmanship tolerances shall be corrected in accordance with Appendix C, Clause C1.1(f) of CSA Standard W59 or referred to the Engineer for approval.

### Workmanship Tolerance for Groove Welds

|                         | Root Not Gouged | Root Gouged                      |
|-------------------------|-----------------|----------------------------------|
| Root Face of Joint      | ± 2mm           | Not Limited                      |
| Root Opening of Joints: |                 |                                  |
| Without steel backing   | ±2mm            | +2mm<br>-3mm                     |
| With steel backing      | + 6mm<br>- 2mm  | Not Applicable<br>Not Applicable |
| Groove Angle of Joint   | + 10°<br>- 5°   | + 10°<br>- 5°                    |

#### S CONTROL OF DISTORTION AND SHRINKAGE STRESSES

Insofar as practicable, all welds shall be deposited in a sequence that will balance the applied heat of welding while the welding progresses.

Before the start of welding on a member or structure in which shrinkage stresses or distortion are likely to effect the adequacy of the structure, a program for welding sequence and distortion control shall be developed by the Contractor.

The direction of the general progression in welding shall be from points where the parts are relatively fixed in position with respect to each other towards points where they have a greater relative freedom of movement.

Joints expected to exhibit significant shrinkage shall be welded first (where practical) while conditions of minimum restraint prevail. Joints expected to have lesser shrinkage shall be welded second.

#### T QUALITY OF WELDS

#### 1. Visual Examination

Cracks or blow holes that appear on the surface of any pass shall be removed before depositing the next covering pass. The procedure and technique shall be such that undercutting of base metal and adjacent passes is minimized.

All welds shall be visually inspected. A weld subject only to visual inspection shall be acceptable if visual inspection shows:

- (a) No surface cracks.
- (b) No visible lack of fusion between welds and base metal.
- (c) No craters.
- (d) Weld profiles in accordance with Clause 5.9 of CSA Standard W59.
- (e) In statically loaded structures, the sum of diameters of visible porosity does not exceed 10mm (3/8") in any linear 25mm (1") of weld and does not exceed 20mm (3/4") in any 300mm (12") length of weld. Any individual pore shall have a dimension not exceeding 2.5mm (3/32").

- (f) In statically loaded structures, irrespective of length, the undercut does not exceed the value shown in Figure 11.4 of CSA Standard W59 for the primary stress direction category applicable to the area containing the undercut. Further, the undercut may be twice the value permitted by Figure 11.4 (for the applicable load category) for an accumulated length of 50mm (2") in a 300mm (12") length of weld but in no case may the undercut be greater than 1.6mm (1/16"). For weld lengths of less than 300mm (12"), the permitted accumulated length of undercut shall be proportional to the actual length of the weld.
- (g) In cyclically loaded structures, the frequency of visible porosity in fillet welds does not exceed one in each 100mm (4") length of weld and the maximum diameter does not exceed 2.5mm (3/32"). That, for fillet welds connecting intermediate transverse stiffeners to web, the sum of the diameters of visible porosity does not exceed 10mm (3/8") in any 25mm (1") of weld nor 20mm (3/4") in any 300mm (12") length of weld. That groove welds have no visible porosity.
- (h) In cyclically loaded structures, the undercut is not more than 0.25mm (0.01") deep when its direction is transverse to the primary stress in the part that is undercut. The undercut is not more than 1mm (1/32") deep when its direction is parallel to the primary stress in the part that is undercut. For members not carrying primary stresses, undercuts in excess of the amounts stated shall be subject to approval by the Engineer.

#### 2. Radiographic and Magnetic Particle Examination

Welds that are subject to radiographic and magnetic particle testing - in addition to visual inspection - shall meet the requirements of:

- (a) Clause 11.5.4.3 of CSA Standard W59 for statically loaded structures.
- (b) Clause 12.5.4.3 of CSA Standard W59 for cyclically loaded structures.

### 3. Ultrasonic Inspection

Welds that are subject to ultrasonic examination in addition to visual inspection shall have no cracks and meet the following requirements:

(a) In statically loaded structures, any weld discontinuity shall be accepted or rejected on the basis of its defect rating and its length in accordance with Table 11.3 of CSA Standard W59.

- (b) In cyclically loaded structures, welds subject to tensile stress under any conditions of loading shall conform to the requirements of Table 12.5 of CSA Standard W59.
- (c) In cyclically loaded structures, welds subject to compressive stress only and specifically indicated as such in the detail drawings shall conform to the requirements of Table 11.3 of CSA Standard W59.

#### U STRESS RELIEF HEAT TREATMENT

Where required by the contract drawings or specifications, welded assemblies shall be stress relieved by heat treatment. Refer to Clause 5.12 of CSA Standard W59.

#### V STORAGE AND CONDITIONING OF ELECTRODES

#### 1. Low-Hydrogen Electrodes

All low-hydrogen electrodes shall be delivered in sealed containers. If such containers show evidence of damage, the low alloy steel electrodes shall be baked for at least 1 hour at a temperature between 370°C (700°F) and 430°C (800°F) before being used and carbon steel electrodes shall be baked for at least 2 hours at a temperature between 230°C (450°F) and 260°C (500°F) before being used.

Immediately after being removed from sealed containers or from baking ovens, the electrodes shall be stored in ovens held at a temperature of at least 120°C (250°F).

Low-hydrogen electrodes of the E49 classification that are not used within 4 hours after removal from the ovens - except as noted in Clause 5.2.2.4.4 of CSA Standard W59 - shall be reconditioned in accordance with clause 5.2.2.4.1.

Low-hydrogen electrodes shall be rebaked no more than once.

When approved by the Contractor's Engineer, auxiliary electrode containers or dispensers may be used to extend permissible exposure times in accordance with the following:

a) The Contractor's Engineer shall be satisfied that such electrode containers or dispensers have been demonstrated to provide adequate atmospheric scaling protection for the contained electrodes at a relative humidity of 90% at 30°C (86°F) for the total storage time proposed for acceptance; and

b) The electrodes so contained shall not produce diffusible hydrogen levels in weld metal in excess of the requirements of CSA Standard W48.

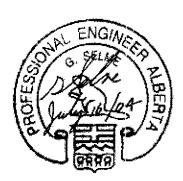

Low-hydrogen electrodes of the E49 classification that are not used within a maximum of 10 hours total exposure time after being removed from ovens and stored in approved electrode containers or dispensers shall be reconditioned in accordance with clause 5.2.2.4.1.

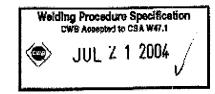

#### 2. Other Than Low-Hydrogen Electrodes

All other than low-hydrogen electrodes shall be stored in warm and dry conditions and kept free from oil, grease and other deleterious matter once they have been removed from their containers and packages.

#### 3. Wet Electrodes

Electrodes that have been wet shall be discarded.

| Weldir     | ng Prod        | edure                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Data S                                | heet                                   | No.           | SS2        | Re                                    | v 0 Date                    | July                                  | 16, 2009    | W47.                     |  |

#### A SCOPE

This Welding Procedure Specification covers welding and related operations in accordance with CSA Standard W59-03 and has been prepared to meet the requirements of Clause 10 of CSA Standard W47.1-03:

#### B WELDING PROCESS

The welding shall be done semi-automatically using the flux cored arc welding process (FCAW) or metal cored arc welding process (MCAW). The joints shall be made by single or multiple pass welding – from one or both sides – as indicated on the Welding Procedure Data Sheets referring to this Specification.

#### C BASE METAL

The base metal shall conform to Steel Groups 1, 2 & 3 of CSA Standard W59 – Table 11.1 and Table 12.1 with the exception of the atmospheric corrosion resistant steels. When atmospheric corrosion resistant steel is used it shall be shown on a separate data sheet. A copy of Tables 11.1 and 12.1 appears in the Appendix.

#### D BASE METAL THICKNESS

Base metal from 3mm (1/8") to unlimited thickness may be welded under this Specification. In cases where base metals less than 3mm (1/8") thick are welded refer to Clause 1.5 of CSA Standard W59.

#### E PREPARATION OF BASE METAL

Surfaces and edges to be welded shall be smooth, uniform and free from fins, cracks and other defects that would adversely affect the quality or strength of the weld. Surfaces to be welded shall also be free, within 50mm (2") of any weld locations, from loose or thick scale (except for tightly adhering small islands of scale), slag, loose rust, paint, grease, moisture and other foreign material that will prevent welding to acceptance criteria of this standard.

Occasional notches, not more than 5mm (3/16") deep on otherwise satisfactory surfaces shall be removed by machining or grinding. Occasional notches exceeding 5mm (3/16") and less than 10mm (3/8") deep, in oxygen cut edges of plate up to 100mm (4") thick, not to be welded, may, with the Contractor's Engineer's approval, be repaired by welding. For material 100mm (4") thick or over the depth of the notch shall not exceed 15mm (9/16"). Such weld repairs shall be made by suitably preparing the defective area, welding with low-hydrogen electrodes to an approved procedure, and grinding the completed weld smooth and flush with the adjacent surface to produce a workmanlike finish.

Planar edge discontinuities of plates are to be inspected in accordance with Clause 5.3.5 of CSA Standard W59.

Re-entrant corners, except for the corners of weld access cope holes adjacent to a flange, shall be filleted to a radius of not less than 12mm (1/2).

The transition from the curved to the straight surface shall be smooth and without offsets.

Preparation of surfaces or edges of the parts to be joined by welding shall be prepared by machining, grinding, chipping, air carbon are or oxygen gouging. Back gouging of welds or the removal of defective work or material shall be done by grinding, chipping, air carbon are or oxygen gouging. Oxygen gouging shall not be used on quenched or tempered steels. Oxygen cutting shall preferably be done by machine oxygen cutting. Oxygen cut edges shall be smooth, regular, and free of slag.

#### F FILLER METAL

The filler metal shall be certified by Canadian Welding Bureau to the requirements of CSA W48 or AWS A5.29. Filler metal shall have a diffusible hydrogen designator of H16 or less.

#### G SHIELDING GAS

The shielding gas shall be as listed on the Welding Procedure Data Sheet. This gas mixture shall be a welding grade having a dew point of -40°C (-40°F) or lower.

#### H WELDING CONDITIONS

Welding shall not be done in a draught or wind unless the weld is protected by a shelter. This shelter shall be of material and shape appropriate to reduce wind velocity in the vicinity of the weld to a maximum of 8 km per hour (5 mph).

No welding shall be done when temperature of the base metal is lower than -18°C (0°F) except with the express consent of the Engineer. At temperatures below 0°C (32°F) the surfaces of all areas within 80mm (3") of the joint where a weld is to be deposited, shall be heated to a temperature at least warm to the hand before welding is commenced, approximately 10°C (50°F).

The operator and the work shall be adequately protected against the direct effect of wind, snow and rain.

#### I POSITION

The welding shall preferably be done in the flat position. The horizontal, vertical, or overhead positions may be used provided approved welding procedure data sheets referring to those positions and this procedure specification are followed. Unless called for otherwise on a specific data sheet, vertical welds shall be made with the progression of each pass in an upward direction. If welds are to be made in a vertical-down sequence, the procedure shall be qualified by welder qualification in accordance with Clause 9.9.3 of CSA Standard W47.1.

#### J PREHEAT AND INTERPASS TEMPERATURES

The minimum preheat and interpass temperature shall be in accordance with Table 5.3 of CSA Standard W59 (as shown in the Appendix). The preheat and interpass temperatures must be sufficient to prevent cracking. Experience has shown that the minimum levels specified in Table 5.3 are adequate to prevent cracking in most cases. However, higher preheat temperatures may be required in situations involving higher restraint, higher hydrogen, certain combinations of steel thickness, lower welding heat input, or steel composition at the top end of the steel specification. Some alternate recognized methods or guidelines for determining preheat are given in Appendix P of CSA Standard W59.

#### K ELECTRICAL CHARACTERISTICS

The welding equipment shall be constant voltage type with constant wire feed speed. Typical amperage, voltage, and wire feed speed ranges for welding is shown below.

#### Electrode Classification E491C-6M-H4

Diameter:

1.2 mm (0.045")

Amperage Range:

200 - 360

Voltage Range:

24 - 29

Wire Feed Speed Range:

230 - 510 ipm

Diameter:

1.6mm (1/16")

Amperage Range:

**290 - 470** 

Voltage Range:

25 - 31

Wire Feed Speed Range:

235 - 410 ipm

#### Electrode Classification E491T-9M-H8

Diameter:

1.2 mm (0.045")

Amperage Range:

220 - 325

Voltage Range:

23 - 29

Wire Feed Speed Range:

360 - 600 ipm

#### L WELDING TECHNIQUE

The maximum size of a fillet well made in one pass shall be 12mm (1/2") for the flat position and 10mm (3/8") for the horizontal position.

The thickness of weld layers – except root and surface layers – shall not exceed 6mm (1/4").

When the root opening of a groove weld is 12mm (1/2") or greater, a multiple pass split layer technique shall be used with the exception of the finishing weld layers. The split layer technique shall also be used in making all multiple pass welds when the width of the layers exceeds 16m (5/8").

Revised Dec 4/06

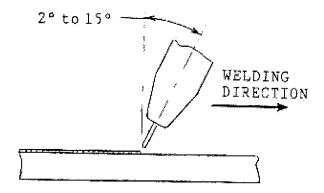

The maximum tolerances of the following parameters listed on the Welding Procedure Data Sheets referring to the Specification are listed below:

Amperage:  $\pm 10\%$ Wire Feed Speed:  $\pm 10\%$ Voltage:  $\pm 7\%$ Arc Travel Speed  $\pm 15\%$ 

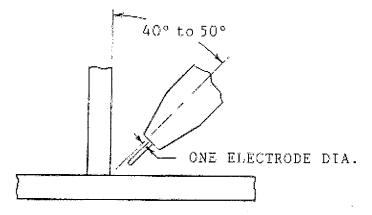

It is very important that the wire extension be kept as constant as possible during the welding operation. The electrode stickout is shown on each Welding Procedure Data Sheet referring to this Specification.

Each pass should fuse properly into any backing plate, preceding pass, or adjacent plate metal. Craters at the end of each weld pass shall be filled in to prevent undercut and cracking.

When making groove and fillet welds in the flat position, the torch should be angled 2° to 15° in the direction of travel as shown below.

When fillet welds are made in the horizontal position, the electrode should have a work angle of 40° to 50° in addition to the 2° to 15° in the direction of travel.

#### M TACK WELDS

Tack welds that are incorporated into the final weld shall be subject to the same quality requirements as the final welds and be made with electrodes meeting the requirements of the final welds and shall be cleaned thoroughly.

Tack welds not incorporated into the final weld shall be removed – except that they need not be removed for statically loaded structures unless required by the Engineer.

Tack welds located in the path of fillet welds 10mm (3/8") or smaller in size, or in the root of joints requiring specific root penetration, shall be sufficiently small that they do not produce objectionable changes in appearance of the weld surface or result in decrease in penetration; otherwise, they shall be removed or reduced in size by any suitable means prior to welding.

#### N WELD PROFILES

The desirable, acceptable, and unacceptable fillet weld profiles are shown in Figure 5.4 in the Appendix.

The acceptable and unacceptable groove weld profiles are shown in Figure 5.4 in the Appendix.

#### O ARC STRIKES

Arc strikes outside the area of permanent welds should be avoided on any material. When they occur in cyclically loaded structures, the surface of the arc strike should be lightly ground and checked for soundness using the magnetic particle inspection method.

#### P TREATMENT OF UNDERSIDE OF WELDED GROOVE

Prior to depositing weld metal on the underside of a welded groove, the root shall be back gouged to produce a groove contour substantially conforming to the prequalified single U-Joint and its depth shall be adequate to ensure complete penetration into the previously deposited weld metal.

#### Q WELD METAL CLEANING

Slag shall be removed from all finished welds and before welding over previously deposited metal.

#### R ASSEMBLY PRACTICES

The parts to be joined by fillet welds shall be brought into as close a contact as practicable. The separation between parts shall normally not exceed 5mm (3/16") except in cases involving shapes and plates 75mm (3") thick or greater when, after straightening and in assembly, the gap cannot be closed sufficiently to meet this tolerance. In such cases, a maximum gap of 8mm (5/16") is acceptable, provided that the scaling weld or suitable backing material\* is used to prevent melt-through.

If the separation is 2mm (1/16") or greater, the leg of the fillet weld shall be increased by the amount of the separation.

The separation between faying surfaces of lap joints and of butt joints landing on a backing shall not exceed 2mm (1/16"). Where irregularities in rolled shapes or plates after straightening do not permit contact within the above limits, the procedure necessary to bring the material within these limits shall be subject to the approval of the Engineer.

The parts, bearing joints excepted, to be joined by partial joint penetration having groove welds parallel to the length of the member shall be brought into as close contact as practicable. The gap between parts shall not exceed 5mm (3/16") except in cases involving rolled shapes and plates 75mm (3") or greater in thickness when, after straightening and in assembly, the gap cannot be closed sufficiently to meet this tolerance. In such cases, a maximum gap of 8mm (5/16") is acceptable provided a sealing weld or suitable backing material\* is used to prevent melt-through and the final weld meets the requirements for throat size. Tolerances for bearing joints shall be in accordance with the applicable contract specification.

The use of fillers is prohibited except as specified on the drawings or as specially approved by the Engineer and made in accordance with Clause 4.6 of CSA Standard W59.

<sup>\*</sup> Backing to prevent burn-through may be of flux, glass tape, iron powder or similar material or it may be provided by means of root passes deposited by a low-hydrogen electrodes or electrodes of other are welding processes that are specified to an appropriate diffusible hydrogen designator.

Abutting parts to be joined by groove welds shall be carefully aligned. However, an offset not exceeding 10% of the thickness of the thinner part joined but in no case more than 3mm (I/8") shall be permitted as a departure from the theoretical alignment. In correcting misalignment in such cases, the parts shall not be drawn into a slope greater than I in 25. Measurement of the offset shall be based on centerline of parts unless otherwise shown on the drawing.

Backing for groove welds shall be continuous for the full length of the joint. Where backing is composed of individual lengths of bars, they shall be carefully aligned and welded into one continuous member.

Members to be welded shall be brought into correct alignment and held safely in position until welding has be completed. Suitable allowances shall be made for warpage and shrinkage.

#### S ALLOWABLE WORKMANSHIP TOLERANCES

With the exclusion of electroslag and electrogas welding and, with the exception of Clause 5.4.5.2 of CSA Standard W59 for root openings in excess of those permitted in the table below, dimensions of the cross-section of groove welded joints that vary from those shown on the detail drawings by more than the following workmanship tolerances shall be corrected in accordance with Appendix C, Clause C1.1(f) of CSA Standard W59 or referred to the Engineer for approval.

#### Workmanship Tolerance for Groove Welds

|                         | Root Not Gouged | Root Gouged                   |
|-------------------------|-----------------|-------------------------------|
| Root Face of Joint      | ± 2mm           | Not Limited                   |
| Root Opening of Joints: |                 |                               |
| Without steel backing   | ±2mm            | +2mm<br>-3mm                  |
| With steel backing      | + 6mm<br>- 2mm  | Not Applicable Not Applicable |
| Groove Angle of Joint   | +10°<br>-5°     | ± 10°<br>- 5°                 |

#### T CONTROL OF DISTORTION AND SHRINKAGE STRESSES

Insofar as practicable, all welds shall be deposited in a sequence that will balance the applied heat of welding while the welding progresses.

Before the start of welding on a member or structure in which shrinkage stresses or distortion are likely to affect the adequacy of the structure, a program for welding sequence and distortion control shall be developed by the Contractor.

The direction of the general progression in welding shall be from points where the parts are relatively fixed in position with respect to each other towards points where they have a greater relative freedom of movement.

Joints expected to exhibit significant shrinkage shall be welded first (where practical) while conditions of minimum restraint prevail. Joints expected to have lesser shrinkage shall be welded second.

#### U QUALITY OF WELDS

#### 1. Visual Examination

Cracks or blow holes that appear on the surface of any pass shall be removed before depositing the next covering pass. The procedure and technique shall be such that undercutting of base metal and adjacent passes is minimized.

All welds shall be visually inspected. A weld subject only to visual inspection shall be acceptable if visual inspection shows:

- (a) No surface cracks.
- (b) No visible lack of fusion between welds and base metal.
- (c) No craters.
- (d) Weld profiles in accordance with Clause 5.9 of CSA Standard W59.
- (e) In statically loaded structures, the sum of diameters of visible porosity does not exceed 10mm (3/8") in any linear 25mm (1") of weld and does not exceed 20mm (3/4") in any 300mm (12") length of weld. Any individual pore shall have a dimension not exceeding 2.5mm (3/32").

- (f) In statically loaded structures, irrespective of length, the undercut does not exceed the value shown in Figure 11.4 of CSA Standard W59 for the primary stress direction category applicable to the area containing the undercut. Further, the undercut may be twice the value permitted by Figure 11.4 (for the applicable load category) for an accumulated length of 50mm (2") in a 300mm (12") length of weld but in no case may the undercut be greater than 1.6mm (1/16"). For weld lengths of less than 300mm (12"), the permitted accumulated length of undercut shall be proportional to the actual length of the weld.
- (g) In cyclically loaded structures, the frequency of visible porosity in fillet welds does not exceed one in each 100mm (4") length of weld and the maximum diameter does not exceed 2.5mm (3/32"). That, for fillet welds connecting intermediate transverse stiffeners to web, the sum of the diameters of visible porosity does not exceed 10mm (3/8") in any 25mm (1") of weld nor 20mm (3/4") in any 300mm (12") length of weld. That groove welds have no visible porosity.
- (h) In cyclically loaded structures, the undercut is not more than 0.25mm (0.01") deep when its direction is transverse to the primary stress in the part that is undercut. The undercut is not more than 1mm (1/32") deep when its direction is parallel to the primary stress in the part that is undercut. For members not carrying primary stresses, undercuts in excess of the amounts stated shall be subject to approval by the Engineer.

#### 2. Radiographic and Magnetic Particle Examination

Welds that are subject to radiographic and magnetic particle testing – in addition to visual inspection – shall meet the requirements of:

- (a) Clause 11.5.4.3 of CSA Standard W59 for statically loaded structures.
- (b) Clause 12.5.4.3 of CSA Standard W59 for cyclically loaded structures.

#### 3. Ultrasonic Inspection

Welds that are subject to ultrasonic examination in addition to visual inspection shall have no cracks and meet the following requirements:

(a) In statically loaded structures, any weld discontinuity shall be accepted or rejected on the basis of its defect rating and its length in accordance with Table 11.3 of CSA Standard W59.

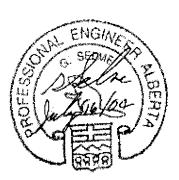

- (b) In cyclically loaded structures, welds subject to tensile stress under any conditions of loading shall conform to the requirements of Table 12.5 of CSA Standard W59.
- (c) In cyclically loaded structures, welds subject to compressive stress only and specifically indicated as such in the detail drawings shall conform to the requirements of Table 11.3 of CSA Standard W59.

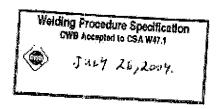

#### V STRESS RELIEF HEAT TREATMENT

Where required by the contract drawings or specifications, welded assemblies shall be stress relieved by heat treatment. Refer to Clause 5.12 of CSA Standard W59.

#### W STORAGE OF ELECTRODES

The electrodes shall be stored in a clean and dry area where contamination by moisture, grease, or dirt can be avoided.

in the second

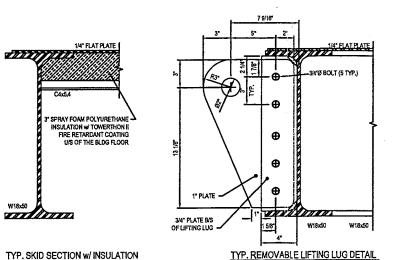

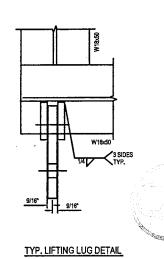

- WELDING SHALL BE IN GENERAL CONFORMANCE WITH CSA
- WELDS TO BE 1/4" CONTINUOUS FILLET WELD UNLESS NOTED. - CHECKER PLATE TO BE STITCH WELDED TO SKID USING 3/16" FILLETS 2" AT 12" INTERVALS.
- CHECKER PLATE SEAMS TO BE WELDED CONTINUOUSLY ON ONE SIDE,
- ALL WORK SHALL GENERALLY CONFORM TO THE LATEST EDITIONS OF THE FOLLOWING CODES AND STANDARDS:
  - \* CSA W47.1-09
  - \* CISC HANDBOOK OF STEEL CONSTRUCTION
- ALL STEEL SHALL BE OF NEW STOCK AND SHALL BE IN ACCORDANCE WITH CSA G40.21-M.
  - \* STRUCTURAL STEEL = GRADE 350W
  - \* CHANNELS & ANGLES = GRADE 300W
  - \* LIFTING LUGS= GRADE 300W
  - \* CHECKER & FLAT PLATE = GRADE 300W
- FILLER METAL SHALL CONFORM TO CSA STD. W48.5-M -E4802C-6-CH.
- 3"-R20 SPRAY FOAM POLYURETHANE INSULATION w/ TOWERTHON II FIRE RETARDANT COATING U/S OF THE BLDG
- FLOOR -1/4" FLAT PLATE DECKING W/ ANTI-SLIP PAINT
- SSPC-SP-6 SURFACE PREPARATION
- PRIME WITH ONE COAT OF CLOVERDALE 710 SERIES PRIMER
- TOPCOAT WITH ONE COAT OF CLOVERDALE 74 SERIES INDUSTRIAL ENAMEL
- STANDARD QC PACKAGE
- FINISH COLOR IS TO BE BLACK

# Certificate of Registration

This is to certify that QUASAR has certified:

## Warwick Industries Ltd.

Plants: 6999 - 84th Street SE, Calgary, AB T2C 4T6 / Gar-Don Steel Industries Ltd., 1308 - 8 Street, Nisku, AB T9E 7M1
Design Office: Laviolette Engineering Ltd., 11729 105 Ave. NW, # 101, Edmonton, AB T6G 1N4

to the Certification Standard:

## CAN/CSA A660-10

"Certification of Manufacturers of Steel Building Systems"

Initial Registration 26 January 2010

Date of Issue 2 March 2012

Date of Expiry 26 January 2013

Certificate Number WARWI0

**Scope**: Self framing steel buildings - design and manufacture of sheet metal parts, design and supply of steel skids and structural steel (where applicable) and erection of buildings.

Registrar
