# Taylor Valve Technology

## Installation and Maintenance Instructions

### Installation

The safety relief valve should always be installed on a tank or piping run in a vertical position with the outlet pointing in a horizontal direction. When threading the valve into the inlet piping, always use a wrench on the inlet connection hex, never use a wrench on the relief valve body.

One of the most common causes of early failure of relief valves is dirt trapped on the valve seat. Welding slag and/or piping teflon tape are among the more common items that cause difficulty. It is recommended that all piping and tank systems be cleaned prior to installation of the relief valve.

A relief valve mounted on a tank should be connected with the minimum amount of piping between the tank and the valve. Further, all piping used must be equal or larger than the inlet pipe size of the relief valve, never smaller. Any restriction of the inlet to a relief valve may cause usual valve chatter or relief capacities below the design ratings of the valve which could result in serious or catastrophic damage. Outlet piping from the relief valve should be less than four (4) feet in length and never of a pipe size smaller than the outlet pipe size of the relief valve. Long runs of small diameter pipe on the outlet side of a relief valve could create a serious hazard to life and property.

Extreme caution is required in the design of outlet piping if installed outdoors where the liquids, if present, could form an ice block in the piping of the relief valve body in below freezing weather. Discharge lines must be weather capped and drained to prevent any liquid collection in the relief valve body or outlet piping. If these precautions are not taken, serious damage and injury could result.

Additional, important installation factors are contained in the following excerpt from para. UG-135 Section VIII of the ASME Boiler Code:

### UG-135 Installation

(a) Safety, safety relief and pilot operated pressure relief valves, and nonreclosing pressure relief devices shall be connected to the vessel in the vapor space above any contained liquid or to piping connected to the vapor space in the vessel which is to be protected.

(b) The opening through all pipe and fittings between a pressure vessel and its pressure-relieving device shall have at least the area of the pressure-relieving device inlet, and the flow characteristics of this upstream system shall be such that the pressure drop will not reduce the relieving capacity below that required or adversely affect the proper operation of the pressure-relieving device. The opening in the vessel wall shall be designed to provide direct and unobstructed flow between the vessel and its pressure-relieving device.

(c) When two or more required pressure-relieving devices are placed on one connection, the inlet internal cross

it, and the flow characteristics of the upstream system shall satisfy the requirements of (b).

(d) Liquid relief valves shall be connected below the normal liquid level.

(e) There shall be no intervening stop valves between the vessel and its protective device or devices, or between the protective device or devices and the point of discharge, except:

(1) When these stop valves are so constructed or positively controlled that the closing of the maximum number of block valves possible at one time will not reduce the pressure relieving capacity provided by the unaffected relieving devices below the required relieving capacity, or

(2) under conditions set forth in Appendix M.

(f) The safety devices on all vessels shall be so installed that their proper functioning will not be hindered by the nature of the vessel's contents.

(g) Discharge lines from pressure relieving safety devices shall be designed to facilitate drainage or shall be fitted with drains to prevent liquid from lodging in the discharge side of the safety device, and such lines shall lead to a safe place of discharge. The size of the discharge lines shall be such that any pressure that may exist or develop will not reduce the relieving capacity of the relieving devices below that required to properly protect the vessel. (See UG-136 (a) (2) and Appendix M.)

### Maintenance

An ASME Coded safety relief valve is factory set with precise pressure gauges and tanks to plus or minus 3% of the stamped set pressure. The valve setting is wired closed and lead sealed. It is recommended that any maintenance work required on the valve be performed by Taylor Valve Technology or a commercial valve repair shop holding a VR Stamp issued by the National Board of Boiler and Pressure Vessel Inspectors of Columbus, Ohio. Normally, an annual cleaning of internal parts, seats and inlet port, is desirable along with resetting, testing and resealing the valve. The seat on the Taylor Valve Technology relief valve is threaded and is easily replaced. The seat and "o" ring seals on the inlet "sub" are normally replaced when the seat is replaced. Taylor Valve Technology manufactured parts must be used for all repairs or serious malfunction is likely to occur.

The pressure setting of the relief valve should never be reset by more than 10% of the set pressure originally stamped on the tag. This new set pressure should be marked on a new tag affixed to the valve by the valve repair company changing the setting.

**If there are further questions  
concerning repair, please contact:

## Elite Stainless Steel Series Pressure Gauges (Liquid Filled)

WGI Elite series brass pressure gauges have a 304 stainless steel case for use in harsh or corrosive environments, liquid filled for significant cushioning and pulsation dampening which reduces pointer flutter and internal damage. Industries suited for include oil and gas equipment, refineries, hydraulic equipment, agricultural equipment pressure washers, pumps, compressors and process systems.

### Specifications

**Case Material**  
304 stainless steel, top nitrile vent plug with valve and lens seal

**Fill Fluid**  
Silicone

**Lens Material**  
Acrylic & safety glass (ranges over 5000psi)

**Dial**  
White aluminum with black and red lettering

**Pointer**  
Black aluminum

**Accuracy**  
Elite 150/250 ± 2%-1%-2% ASME B40.1 Grade A  
Elite 400 ± 1% full scale ASME B40.1 Grade A

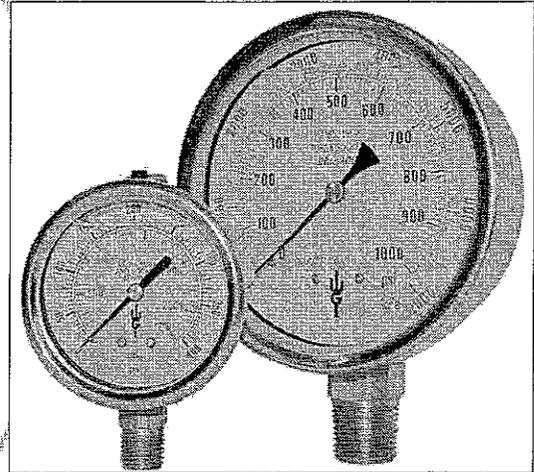

**Tube & Socket**  
316L stainless steel

**Temperature Limits**  
-60°C to 60°C ambient and medium

**Pressure Ranges**  
-30" Hg. Vacuum to 15,000 psi/kpa

**Sizes**  
1½", 2½" & 4"

**Canadian Registration Number (CRN)**  
CSA-OF5299:25

# Apollo 62-100 Series

## Stainless Steel Ball-Cone® Check Valve

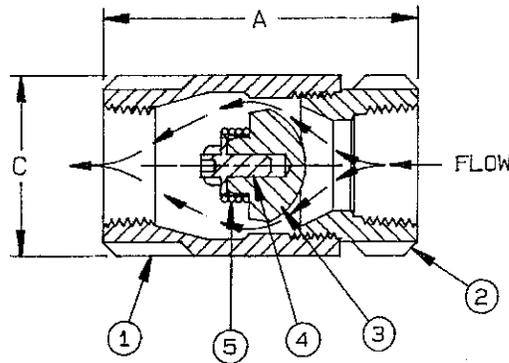

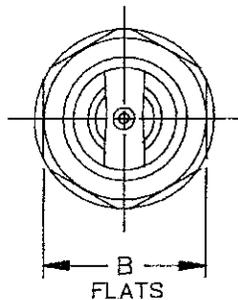

NPT Threaded 1/4" through 2" 400 psig WOG, Cold Non-Shock 125 psig Saturated Steam

### FEATURES

- U.S. Patent #4,172,465
- No radial alignment necessary
- Tight shutoff
- Optional light spring available (62-12X-Series)
- Ball-Cone check is spring-loaded for fast seating action
- Straight through stream lined for minimum change in velocity
- Investment cast body

### STANDARD MATERIAL LIST

1 Body	ASTM A351-CF8M	4. Guide	ASTM A276-316
2 Tail Piece	ASTM A276-316 (1/4" to 1")	5. Spring	AISI 316 SS
3 Ball Check	ASTM A351-CF8M (1-1/4" to 2") RPTFE

NOTE: NOT ALL COMBINATIONS AVAILABLE. CONTACT CUSTOMER SERVICE FOR VERIFICATION

NOTE: Not recommended for use with reciprocating pumps and similar applications with repetitious vibrations. Upstream flow disturbances which create turbulence may result in rapid wear and premature valve failures. It is recommended that a minimum of 10 diameters of straight pipe be provided between the check valve inlet and any upstream flow disturbance such as pumps, control valves, elbows, etc. It is also recommended that a minimum of 2 diameters of straight pipe be allowed downstream of the valve outlet. Low flow rates may also cause high frequency vibrations.
